

other new independent claim remain the features of the claim 6 (also removes the metal cap and the spring) added with the limit of the amended claim 7, new claims 9, 10, 11, and 12 remain the features of the original claims 2, 3, 4 and 5 dependent on the amended claim 7. The new claim 14 in the amendment on 09/21/05 is the original claim 8 added with the limit of claim 7 now is cancelled because it may have a scope larger than the amended claim 7. Thereby, it is assured that the new claims 9-13 are based on the original claims and thus no new matter is added. The relation of the new claims with respect to the original claims are illustrated in the following REMARK from which Examiner can know the relation easily.

AMENDMENT

IN THE CLAIM

Please cancel the claims 1 to 6 and 8, without prejudice or disclaimer of the subject matter thereof, and add new claims 9-13, in that, the amended and new claims are re-written according to the official actions, such as the allowable limitation "a buckling ring" is used instead of the "spring and metal cap".

List of Claims

Claims 1-6. (cancelled)

Claim 7. (currently amended) ~~The~~ A touch controlled lighting emitting device as claimed in claim 1, further comprising: a base having a device groove at an upper end thereof and a hollow battery set at a lower end thereof; a light emitting body installed in the battery groove; a conduction unit having the function of spring and metal cap; a top of the conduction unit having a buckling ring enclosing a periphery of the battery set; and a length of the buckling ring being larger than an expandable spring of the battery set; a lower edge of the buckling ring extends with an L shape guide sheet; a horizontal section of the guide sheet having a convex portion; and the convex portion of the horizontal section being retained with a predetermined distance to the electrode; wherein a bottom of the device groove of the base is formed with at least one through hole which is communicated with the battery groove; a wall of the device groove is formed with at least one axial slot; a wall of the battery groove is formed with at least one axial recess; each slot is communicated with a respective recess; the short lead of the light emitting body passes through the through hole to be in contact with a top electrode of the battery set in the battery groove; the long lead extends through one slot of the device groove and then bends downward to be in contact with the buckling ring; further, the wall of the battery groove are formed with two notches; a lower inner wall of the battery groove is formed with a ring.

Claim 8. (cancelled)

Claim 9. (new) A touch controlled lighting emitting device as claimed in claim 7, wherein there are two through holes at the bottom of the device groove; and there are two slots and two recesses which are arranged at opposite sides of the walls of the device groove and battery groove respectively, the two through holes, two slots, two recesses are at the same diameter line of the bottom of the device groove.

Claim 10. (new) A touch controlled lighting emitting device as claimed in claim 7, wherein the two through holes are in a radial recess at the bottom of the device groove; the long lead is embedded in the radial recess.

Claim 11. (new) A touch controlled lighting emitting device as claimed in claim 7, wherein the light emitting body includes an IC board and an IC, and light emitting elements.

Claim 12 (new) A touch controlled lighting emitting device as claimed in claim 7, wherein at least one sound emitting element is in the device groove.

Claim 13 (new) A touch controlled lighting emitting device comprising: a base having a device groove at an upper end thereof and a hollow battery set at a lower end thereof; a sound emitting body installed on the device groove having a long lead and a short lead; a battery set installed in the battery groove; a conduction unit having the function of spring and metal cap; a top of the conduction unit having a buckling ring enclosing a periphery of the battery set and a length of the buckling ring being larger than an expandable spring of the battery set; a lower edge of the buckling ring extends with an L shape guide sheet; a horizontal section of the guide sheet having a convex portion; and the convex portion of the horizontal section being retained with a predetermined distance to the electrode; wherein a bottom of the device groove of the base is formed with at least one through hole which is communicated with the battery groove; a wall of the device groove is formed with at least one axial slot; a wall of the battery groove is formed with at least one axial recess; each slot is communicated with a respective recess; the short lead of the light emitting body passes through the through holes to be in contact with a top electrode of the battery set in the battery groove; the long lead extends with the spring; further, the wall of the battery groove are formed with two notches; a lower inner wall of the battery groove is formed with a ring.
